

# Contents

<b>1</b>	<b>Introduction</b>	<b>6</b>
<b>2</b>	<b>Balance equations</b>	<b>8</b>
2.1	Instantaneous balance equations . . . . .	8
2.2	Reynolds and Favre averaging . . . . .	10
2.3	Favre averaged balance equations . . . . .	11
2.4	Filtering and Large Eddy Simulation . . . . .	13
<b>3</b>	<b>Major properties of premixed, nonpremixed and partially premixed flames</b>	<b>16</b>
3.1	Laminar premixed flames . . . . .	16
3.2	Laminar diffusion flames . . . . .	18
3.3	Partially premixed flames . . . . .	25
<b>4</b>	<b>A direct analysis: Taylor's expansion</b>	<b>27</b>
<b>5</b>	<b>Scales and diagrams for turbulent combustion</b>	<b>29</b>
5.1	Introduction . . . . .	29
5.2	Turbulent premixed combustion diagram . . . . .	30
5.2.1	Introduction . . . . .	30
5.2.2	Combustion regimes . . . . .	30
5.2.3	Comments . . . . .	34
5.3	Nonpremixed turbulent combustion diagram . . . . .	35
5.3.1	Introduction . . . . .	35
<b>6</b>	<b>Tools for turbulent combustion modeling</b>	<b>39</b>
6.1	Introduction . . . . .	39
6.2	Scalar dissipation rate . . . . .	40
6.3	Geometrical description . . . . .	43
6.3.1	$G$ -field equation . . . . .	43
6.3.2	Flame surface density description . . . . .	45
6.3.3	Flame wrinkling description . . . . .	50
6.4	Statistical approaches: Probability density function . . . . .	51
6.4.1	Introduction . . . . .	51
6.4.2	Presumed probability density functions . . . . .	52
6.4.3	Pdf balance equation . . . . .	53
6.4.4	Joint velocity/concentrations pdf . . . . .	56
6.4.5	Conditional Moment Closure (CMC) . . . . .	57
6.5	Similarities and links between the tools . . . . .	58

<b>7</b>	<b>Reynolds-averaged models for turbulent premixed combustion</b>	<b>62</b>
7.1	Turbulent flame speed . . . . .	62
7.2	Eddy-Break-Up model . . . . .	63
7.3	Bray-Moss-Libby (BML) model . . . . .	64
7.3.1	Introduction . . . . .	64
7.3.2	BML model analysis . . . . .	66
7.3.3	Recovering mean reaction rate from tools relations . . . . .	69
7.3.4	Reynolds and Favre averaging . . . . .	71
7.3.5	Conditional averaging - Counter-gradient turbulent transport . . . . .	71
7.4	Models based on the flame surface area estimation . . . . .	74
7.4.1	Introduction . . . . .	74
7.4.2	Algebraic expressions for the flame surface density $\Sigma$ . . . . .	74
7.4.3	Flame surface density balance equation closures . . . . .	80
7.4.4	Analysis of the flame surface density balance equation . . . . .	82
7.4.5	Flame stabilization modeling . . . . .	90
7.4.6	A related approach: $G$ -equation . . . . .	90
<b>8</b>	<b>Turbulent transport in premixed combustion</b>	<b>91</b>
8.1	Introduction . . . . .	91
8.2	Direct numerical simulation analysis of turbulent transport . . . . .	92
8.2.1	Introduction . . . . .	92
8.2.2	Results . . . . .	92
8.3	Physical analysis . . . . .	94
8.4	External pressure gradient effects . . . . .	99
8.5	Counter gradient transport - Experimental results . . . . .	100
8.6	To include counter-gradient turbulent transport in modeling . . . . .	103
8.7	Towards a conditional turbulence modeling ? . . . . .	105
<b>9</b>	<b>Reynolds averaged models for nonpremixed turbulent combustion</b>	<b>106</b>
9.1	Introduction . . . . .	106
9.2	Fuel/Air mixing modeling . . . . .	108
9.2.1	Introduction . . . . .	108
9.2.2	Balance equation and simple relaxation model for $\tilde{\chi}$ . . . . .	108
9.3	Models assuming infinitely fast chemistry . . . . .	110
9.3.1	Eddy Dissipation Model . . . . .	110
9.3.2	Presumed pdf: infinitely fast chemistry model (IFCM) . . . . .	111
9.4	Flamelet modeling . . . . .	112
9.4.1	Introduction . . . . .	112
9.4.2	Flame structure in composition space, $Y_i^{SLFM}(Z^*, \chi^*)$ . . . . .	112
9.4.3	Mixing modeling in SLFM . . . . .	118
9.4.4	Conclusion . . . . .	120

9.5	Flame surface density modeling, Coherent Flame Model (CFM)	120
9.6	MIL model	121
9.7	Conditional Moment Closure (CMC)	124
9.8	Pdf modeling	125
9.8.1	Turbulent micromixing	127
9.8.2	Linear relaxation model, IEM/LMSE	128
9.8.3	GIEM model	129
9.8.4	Stochastic micromixing closures	130
9.8.5	Interlinks PDF / Flame surface modeling	134
9.8.6	Joint velocity/concentrations pdf modeling	135
<b>10</b>	<b>Large eddy simulation</b>	<b>136</b>
10.1	Introduction	136
10.2	Unresolved turbulent fluxes modeling	136
10.2.1	Smagorinsky model	137
10.2.2	Scale similarity model	137
10.2.3	Germano dynamic model	137
10.2.4	Structure function models	138
10.2.5	Unresolved scalar transport	139
10.3	Simplest approaches for combustion modeling	139
10.3.1	Arrhenius law based on filtered quantities	139
10.3.2	Extension of algebraic Favre averaged approaches	140
10.3.3	Simple extension of the Germano dynamic model	140
10.4	LES models for non premixed combustion	141
10.4.1	Linear Eddy Model	141
10.4.2	Dynamic micro-mixing model	142
10.4.3	Probability Density functions	143
10.5	LES models for premixed combustion	144
10.5.1	Introduction	144
10.5.2	Artificially thickened flames	145
10.5.3	$G$ -equation	146
10.5.4	Filtering the progress variable balance equation	148
10.6	Numerical costs	151
<b>11</b>	<b>Conclusion</b>	<b>152</b>
