

Vortex Sound Theory and Application to Jet Noise Prediction

C. Schram *
LMS International

24 April 2006

Contents

1	Introduction	3
2	Lighthill's analogy	5
2.1	Conservation of mass and momentum	5
2.2	Crocco, Bernoulli and stagnation enthalpy	6
2.3	Lighthill's analogy	7
3	Vortex sound theory	13
3.1	Vorticity dynamics	13
3.2	Powell's analogy	15
3.2.1	Quadrupolar turbulence noise	17
3.3	Howe's analogy	18
3.3.1	Acoustic propagation in an irrotational mean flow	18
3.3.2	Stagnation enthalpy as acoustical variable	19
3.4	Möhring's analogy	20
3.5	Discussion	21
3.6	Axisymmetrical flow	22
4	Sound produced by leapfrogging	25
4.1	Two-dimensional model	25
4.1.1	Flow model	25
4.1.2	Impulse and kinetic energy	27
4.1.3	Sound production	28
4.1.4	Möhring's solution	29
4.1.5	Discussion	31
4.2	Three-dimensional model	31

*The present lecture notes are widely inspired from the PhD thesis carried out by Schram (2003), under the co-supervision of Prof. A. Hirschberg, Prof. M.L. Riethmuller, Prof. G. Degrez and Prof. M.E.H. van Dongen.

4.2.1	Flow model	31
4.2.2	Impulse and kinetic energy	32
4.2.3	Sound production	33
5	Conservative formulation of VST	35
5.1	Robustness	36
5.1.1	Reference case: unperturbed vortex interaction	36
5.1.2	Effect of the addition of random noise	38
5.1.3	Summary	40
6	Application to PIV measurements	43
6.1	PIV measurements	43
6.2	Flow invariants	46
6.3	Sound production	48
6.4	Acoustical measurements	51
6.5	Comparison with prediction	53
7	Conclusions	55
A	Derivation of the conservative formulation (94)	61
