

Interfacing a Boundary Element Method with low-order CFD

and

Automotive Examples

C. Schram *and W. Desmet†

27 April 2006

Contents

1	Introduction	3
2	Aeroacoustical analogy	5
2.1	Lighthill's analogy	5
2.2	Curle's analogy	10
2.3	Ffowcs Williams & Hawkings analogy	12
3	Numerical implementation	15
3.1	Numerical acoustics in a nutshell	15
3.1.1	Finite Element Method	16
3.1.2	Boundary Element Method: direct and indirect formulations	17
4	Incompressible data in Curle's analogy	21
4.1	Reminder	21
4.2	Example case	22
4.2.1	Kinematic model	22
4.2.2	Sound prediction using a tailored Green's function	24
4.2.3	Sound prediction using Curle's source terms	25
4.2.4	Comparison between both methods	27
4.3	Discussion	28

*Aeroacoustics Project Leader, LMS International

†Professor, PMA Division, Katholieke Universiteit Leuven

5	Automotive examples	31
5.1	Side mirror noise: exterior radiation	31
5.1.1	Geometry	31
5.1.2	Flow field simulation	31
5.1.3	Aeroacoustic prediction	32
5.2	HVAC blower noise	35
5.2.1	CFD computations	35
5.2.2	Acoustical analysis	37
5.2.3	Experimental validation	37
5.3	Wind-induced buffeting: Helmholtz resonator	39
5.3.1	Helmholtz resonator	39
5.3.2	CFD calculations	40
5.3.3	Generation of the equivalent aeroacoustical sources	40
5.3.4	Multi-Domain Direct BEM calculation	41
5.3.5	Results	42
