

Spray Combustion

Dr.-Ing. Rainer Koch
Institut für Thermische Strömungsmaschinen
Universität Karlsruhe
Germany

June 6, 2007

Contents

1	Introduction	3
2	Atomization and sprays	5
2.1	Basics of droplet breakup	5
2.2	Droplet breakup in turbulent flows	5
2.3	Liquid breakup mechanism	6
2.3.1	Rayleigh breakup	6
2.3.2	Prompt atomization	6
2.4	Characteristics of sprays	8
2.4.1	Rosin-Rammler droplet size distribution function	10
2.4.2	Log-normal droplet size distribution function	10
2.5	Dense and dilute sprays	11
3	Mechanics of droplet motion	13
3.1	Laminar gas flow	13
3.2	Turbulent gas flow	14
3.3	Numerical approaches	15
3.3.1	Locally homogeneous flow(LHF)	15
3.3.2	Euler-Euler technique (EET)	16
3.3.3	Euler-Lagrange technique (ELT)	17
3.3.4	Comparison of the numerical approaches	17
4	Droplet evaporation	21
4.1	Basics of droplet evaporation	21
4.1.1	Single - multi fluid evaporation	21
4.1.2	Processes of droplet evaporation	21
4.2	Models for single component fuels	22
4.2.1	D ² Model	22
4.2.2	Simplified single component evaporation models	24
4.2.3	The uniform temperature model	26

4.3	Models for multi component fuels	27
5	Single droplet combustion	33
5.1	Quasi-steady theory	33
5.1.1	Nomenclature	34
5.1.2	Conservation equations for quasi-steady droplet combustion	34
5.1.3	Boundary conditions	34
5.1.4	Fuel concentration at the droplet surface	35
5.1.5	Droplet surface temperature	35
5.1.6	Droplet evaporation without flame	36
5.2	Combustion with convection	36
5.2.1	Flame types of single droplet combustion with convection	36
5.2.2	Transition between the flame types of single droplet combustion	37
6	Spray combustion	41
6.1	Droplet group combustion theory	41
6.2	Concluding remarks	44
7	Selected examples	45
7.1	Study of a spray flame	45
