

# Gas Turbine Combustion

Three case studies for the analysis of low emission combustion systems

Peter Flohr\*, Felix Güthe, Valter Bellucci

ALSTOM (Schweiz) AG

## Contents

<b>1</b>	<b>Introduction</b>	<b>2</b>
<b>2</b>	<b>Prediction of flow &amp; mixing in a gas turbine burner</b>	<b>2</b>
2.1	Introduction . . . . .	2
2.2	Analytical model of the burner flow & mixing . . . . .	3
2.3	CFD analysis of the burner flow & mixing . . . . .	5
2.4	Summary . . . . .	7
<b>3</b>	<b>Using thermoacoustic analysis for robust burner design</b>	<b>8</b>
3.1	Introduction . . . . .	8
3.2	LEV single burner design . . . . .	9
3.3	LEV thermoacoustic model . . . . .	9
3.4	Results . . . . .	12
3.5	Summary . . . . .	13
<b>4</b>	<b>Reheat combustion: the proven pathway to low emissions</b>	<b>13</b>
4.1	Introduction . . . . .	13
4.2	Basic reheat features for low emissions . . . . .	14
4.3	Generic operational and fuel flexibility . . . . .	16
4.4	Engine experience . . . . .	17
4.5	Summary . . . . .	18
<b>5</b>	<b>Figures</b>	<b>19</b>
