1	Introduction	4
2	Random processes	4
2.1	Introduction	4
2.2	Ensemble averages	5
2.3	Time averaging	6
3	Spectral analysis of continuous signal	7
3.1	Introduction	7
3.2	Spectral analysis of finite energy signal	7
3.2.1	Spectral analysis of one signal	7
3.2.2	Cross spectral density of two signals	9
3.3	Spectral analysis of periodic signals	9
3.4	Spectral analysis of finite power signals	11
3.5	Spectral analysis of a random process	12
3.5.1	Power spectral density of a random process	12
3.5.2	Cross-spectral density and coherence function	13
4	Signal discretization	14
4.1	Introduction	14
4.2	Analog to Digital conversion	15
4.3	Temporal resolution required to sample a signal	15
4.3.1	Discrete Fourier transform	15
4.3.2	The sampling theorem	17
4.3.3	Examples	18
4.4	Practical consequences	18
5	Spectral estimates from fast Fourier transform	19
5.1	Practical computations of power spectral density	19
5.1.1	Direct estimation of power spectral densities	19
5.1.2	Estimation of power spectral densities from the autocorrelation function	22
5.2	Comments about irregularly sampled data	24
5.2.1	Introduction	24
5.2.2	To deal with irregularly sampled data	25
5.2.3	Signal reconstruction	26
6	Others applications of Fourier analysis	27
6.1	Interpolation: “zero padding technique”	27
6.2	Determination of the response of a linear system	27
6.3	Determination of the complex signal associated to a real signal	29
6.4	Determination of the signal envelope using Fourier transform	30
7	Modern spectral analysis methods	30
7.1	Introduction	30
7.2	Autoregressive methods	32
7.3	Prony’s method	35
7.4	Example of data processing using autoregressive methods	35
