

Numerical methods: LES and hybrid RANS/LES

Marc Terracol
ONERA, CFD and Aeroacoustics Department

March 10, 2009

Contents

1	Introduction	3
2	Large-Eddy Simulation	5
2.1	The concept of scale separation	5
2.2	Governing equations and subgrid terms	8
2.2.1	Navier-Stokes equations	8
2.2.2	Filtered Navier-Stokes equations	9
2.2.3	Decompositions of the subgrid stress tensor	10
2.3	Closure solutions	10
2.3.1	Functional models	11
2.3.2	Wall-damping modifications and dynamic models	12
2.3.3	Structural models	15
2.3.4	Mixed models	16
2.4	Numerical issues: “real-life” LES	17
2.4.1	Effective filter and cutoff length	17
2.4.2	Discrete filters and cutoff length	19
2.4.3	Usual grid resolution requirements	20
2.5	Final comments	21
3	Hybrid RANS/LES methods	23
3.1	Motivations and statement of the problem	23
3.2	Detached-Eddy Simulation (DES)	23
3.2.1	General idea	23
3.2.2	DES based on the SA model: DES97	24
3.2.3	Solutions against MSD and GIS	26
3.3	Zonal RANS/LES techniques	28
3.3.1	Motivations and theoretical implications	28
3.3.2	Communications between RANS and LES domains	31
A	Appendix: Filtered Navier-Stokes equations for a compressible fluid	37

B Turbulent inflow B.C. for LES	41
B.1 Re-scaling methods	41
B.1.1 Recycling techniques	41
B.1.2 Use of a precursor simulation	44
B.2 Turbulence reconstruction methods	45
B.2.1 Random fluctuations	45
B.2.2 Inverse Fourier transform	46
B.2.3 Random Fourier modes generation	46
B.2.4 Synthetic turbulence generation	47
