

Large-eddy simulation of turbulent flows.

Part 1: Introduction

Ugo Piomelli

Department of Mechanical and Materials Engineering
Queen's University
Kingston (Ontario) Canada

February 22-27, 2010

Contents

1	Introduction	3
1.1	Motivation	3
1.2	Objectives and plan	4
2	Turbulence: a brief review	5
2.1	What is turbulence?	5
2.2	Transition to turbulence	5
2.3	Scales of turbulence	6
2.4	Free shear flows	8
2.4.1	Wakes	8
2.4.2	Jets	9
2.4.3	Mixing layers	9
2.5	Wall-bounded flows	9
3	Simulation techniques	11
3.1	RANS, DNS and LES	11
3.2	Resolution requirements	13
3.2.1	Direct simulations	13
3.2.2	Large-eddy simulation	14
4	Governing equations	17
4.1	The Navier-Stokes equations	17
4.2	The filtered Navier-Stokes equations	17
4.2.1	The filtering operation	17
4.2.2	The filtered equations of motion — incompressible case	20
4.2.3	The filtered equations of motion — compressible case	21

5	Initial and boundary conditions	23
5.1	Initial conditions	23
5.2	Periodic conditions	23
5.3	Outflow conditions	24
5.4	Inflow conditions	24
5.5	Wall boundary conditions	27
6	Subgrid-scale modelling	29
6.1	Energy transfer mechanisms	29
6.2	Eddy viscosity models	30
6.3	Smagorinsky model	31
6.4	Two-point closures	31
6.5	Scale-similar and mixed models	33
6.6	Dynamic models	34
6.7	Deconvolution models	36
6.8	Tensor eddy-diffusivity model	37
6.9	Implicit LES	38
7	Applications of LES	40
7.1	Building-block flows	40
7.2	Transitional and relaminarizing flows	41
7.3	Flows with separation	47
7.4	Aeroacoustics	48
8	Challenges	51
8.1	Complex geometries	51
8.2	URANS and LES	52
8.3	LES software	55
8.4	Wall-layer treatments	55
9	Conclusions	62
