Contents

1 Introduction **3**

2 The Physics of Thermo-Acoustic Instabilities **4**

3 Stability Analysis **8**
3.1 Unsteady simulation 9
3.2 Determination of eigenmodes and eigenfrequencies 11
3.2.1 Eigenfrequencies of the n-τ-model 12
3.2.2 Further remarks on dynamic stability analysis 16
3.3 The Nyquist Criterion 18
3.3.1 Nyquist plots in control theory 18
3.3.2 Application of the Nyquist criterion to thermo-acoustic systems . . 19
3.3.3 Identification of eigenfrequencies and growth rates from a Nyquist plot 21
3.4 Acoustic energy budget 22
3.5 Further reading 24

4 On Overview of System Models **25**
4.1 Finite-Volume / Finite-Element models 26
4.1.1 Computational fluid dynamics 26
4.1.2 Computational acoustics 27
4.2 Modal Expansion 29

5 Network Models **31**
5.1 Review of previous work 32
5.2 Compact element 33
5.3 Ducts 36

5.3.1 Thin annular duct 36
5.3.2 Ducts with varying cross-sectional area 37
5.3.3 Joints and forks 37
5.4 Compact flame 38
5.5 Example network calculations 39

6 State-space models **41**
6.1 Acoustic eigenmodes of a resonator tube 42
6.2 A state-space "network model" for the resonator tube 44
6.3 A state-space model for the n-τ thermoacoustic system 45
6.4 Non-normal effects 47

7 Conclusion **49**

8 Acknowledgements **49**

9 Characteristic equation **50**

10 Finding roots **51**
