

Self-sustained oscillations in duct systems

Devis Tonon and Avraham Hirschberg *

Eindhoven University of Technology

Fluid Dynamics Laboratory, Faculty of Applied Physics

P.O. Box 513, 5600 MB, Eindhoven, The Netherlands

November 18, 2010

Contents

1	Introduction	3
1.1	Flow induced pulsations	3
1.2	Trapped acoustic modes	3
1.3	Examples of field experience	4
2	Basic Concepts	7
2.1	Vortex Sound	7
2.2	Acoustic and hydrodynamic modes	9
2.3	Free, forced and self-sustained oscillations	12
2.4	The shear layer instability and saturation	15
3	Prediction of self-sustained oscillations	19
3.1	Energy Balance	19
3.2	Low, moderate and high amplitudes	19
4	Global acoustic behavior of a pipe system	25
4.1	Acoustic delimiters in a pipe system	25
4.2	Low frequency modeling	25
5	Sound sources at pipe bifurcations	29
5.1	Main flow configurations	29
5.1.1	Main flow configurations of a T-junction	29
5.1.2	Main flow configurations of a cross-junction	31
5.2	Local acoustic field	32
5.2.1	Acoustic flow limit cases of a T-junction	33
5.2.2	Acoustic flow limit cases of a cross-junction	33

*This work is being sponsored by European Commission Marie Curie RTN Project AETHER (contract nbr MRTN-CT-2006-035713).

6	Source modeling at pipe bifurcations	35
6.1	Experimental characterization of the sound sources	35
6.2	Linear models	37
6.3	Single vortex model	38
6.3.1	Single vortex model with calculated path and circulation	38
6.3.2	Single vortex model with imposed path and calculated circulation	38
6.3.3	Single vortex model with imposed path and distributed vorticity	39
6.3.4	Quasi-steady limit	39
6.4	Models with numerical solution of the flow field	39
6.4.1	Vortex blob simulations	40
6.4.2	Laminar and incompressible numerical simulations	41
6.4.3	Unsteady, turbulent and compressible numerical simulations	42
6.5	Full numerical models	42
7	Dissipation of acoustical energy	45
7.1	Radiation of acoustic waves	45
7.2	Wall vibrations	45
7.3	Visco-thermal dissipation	48
7.4	Dissipation by vortex shedding	50
8	Flow induced pulsations in single and double closed branch resonators	55
8.1	Single closed branch resonator	55
8.1.1	Single deep side branch	55
8.1.2	Impact of boundary conditions	56
8.1.3	Energy balance in a single side branch resonator	58
8.2	Double closed branch resonator	61
8.2.1	Impact of main flow and acoustic flow configurations	64
8.2.2	Effect of the resonance of the upstream and downstream main pipe segments	66
9	Remedial measures for the prevention of the self-sustained oscillations	69
9.1	Detuning of the length of the closed branches	69
9.2	Anti-vortex insert	72
9.3	Spoiler, sharp trailing edge and orifice plate	72
9.4	Active control techniques	73
