

Spray Combustion

Dr.-Ing. Rainer Koch
Institut für Thermische Strömungsmaschinen
Karlsruhe Institute of Technology (KIT)
Karlsruhe, Germany

March 23, 2011

Contents

1	Introduction	3
2	Atomization and sprays	5
2.1	Atomizers basics	5
2.2	Types of atomizers	5
2.3	Liquid breakup mechanism	7
2.3.1	Rayleigh breakup	7
2.3.2	Prompt atomization	8
2.4	Secondary breakup	10
2.5	Droplet breakup in turbulent flows	11
2.6	Mechanisms of droplet breakup	12
2.7	Characteristics of sprays	14
2.7.1	Rosin-Rammler droplet size distribution function	17
2.7.2	Log-normal droplet size distribution function	18
2.8	Dense and dilute sprays	18
3	Mechanics of droplet motion	21
3.1	Laminar gas flow	21
3.2	Turbulent gas flow	22
3.3	Numerical approaches	23
3.3.1	Locally homogeneous flow(LHF)	23
3.3.2	Euler-Euler technique (EET)	24
3.3.3	Euler-Lagrange technique (ELT)	26
3.3.4	Comparison of the numerical approaches	27
4	Droplet evaporation	29
4.1	Basics of droplet evaporation	29
4.1.1	Single - multi fluid evaporation	29
4.1.2	Processes of droplet evaporation	29
4.2	Models for single component fuels	30

4.2.1	D ² Model	30
4.2.2	Simplified single component evaporation models	32
4.2.3	The uniform temperature model	35
4.3	Models for multi component fuels	36
5	Single droplet combustion	43
5.1	Quasi-steady theory	43
5.1.1	Nomenclature	44
5.1.2	Conservation equations for quasi-steady droplet combustion	44
5.1.3	Boundary conditions	44
5.1.4	Fuel concentration at the droplet surface	45
5.1.5	Droplet surface temperature	45
5.1.6	Droplet evaporation without flame	46
5.2	Combustion with convection	47
5.2.1	Flame types of single droplet combustion with convection	47
5.2.2	Transition between the flame types of single droplet combustion	47
5.2.3	Concluding remarks	49
6	Spray combustion	51
6.1	Droplet group combustion theory	51
6.1.1	Concluding remarks	54
6.2	Modern low emission spray flames	54
7	Selected examples	57
7.1	Study of a spray flame	57
