

RADIATIVE HEAT TRANSFER IN COMBUSTION SYSTEMS

P. Docherty and M. Fairweather

British Gas plc, Midlands Research Station, Wharf Lane, Solihull,
West Midlands B91 2JW, England

CONTENTS

1.	Introduction.....	2
2.	Radiative Heat Transfer in Non-Homogeneous Systems.....	4
2.1	The Zone Method.....	5
2.2	Statistical Methods.....	6
2.3	Flux Methods.....	7
2.4	The Discrete Transfer Method.....	9
2.5	Discussion.....	10
3.	Gas Radiation.....	11
3.1	Energy Storage in Gases.....	11
3.2	Line Profiles.....	12
3.2.1	Line Shapes.....	13
3.2.2	Radiation from Lines of a Specified Shape.....	14
3.3	Band Models.....	15
3.3.1	Introduction.....	15
3.3.2	Narrow Band Models.....	16
3.3.2.1	The Elsasser and Mayer-Goody Models.....	17
3.3.2.2	Approximations to the Elsasser and Mayer-Goody Models.....	18
3.3.2.3	The Quasi-Random Model.....	19
3.4	Wide Band Models.....	19
3.4.1	The Exponential Wide Band Model.....	20
3.5	Overlap of Spectral Bands.....	23
3.6	Total Emissivity Models.....	24
4.	Particle Radiation.....	27
4.1	Introduction.....	27
4.2	Coal, Char, Ash and Large Droplets.....	28
4.3	Soot Particles.....	29
4.3.1	Optical Properties.....	29
4.3.2	Radiative Properties of Soot.....	29
4.3.3	Shape Effect.....	30
4.3.4	Mean Absorption Coefficient.....	30
5.	Discussion.....	31
6.	Example Applications.....	32
7.	Concluding Remarks.....	33
8.	Nomenclature.....	34
9.	Acknowledgements.....	36
10.	References.....	36
	Figures.....	41
